

WW-241 10 FRAME WINTERING INNER COVER

Our ten-frame Wintering Inner Cover is designed to allow winter feeding of candy boards in colder temperatures and feeding using a Mason jar in warmer weather.

To use this cover year-round, use it shallow side down for normal bee spacing and feeding in warm weather. A notch is provided in the cover's frame that can be used for ventilation or an extra entrance. If warm weather feeding is necessary, attach a Mason jar (not included) to the metal lid (included) and put an empty super over the jar, followed by the telescoping cover. It is imperative when feeding in this manner that the jar is completely full when it is turned upside down, and that the lid is on securely to prevent leaking.

The production of a candy board is done in the wintering inner cover itself. To make candy for one Wintering Inner Cover, place Wintering Inner Cover deep side up on a protected table or counter top. Attach a Mason jar to the metal lid and insert lid into the center hole of the cover. Bring one US pint (16 US Fluid Oz. or 473.18ml) water to a boil in a large pot. Add 5 lbs. (2.27 kg) granulated sugar and heat until a candy thermometer reads 240°F (115.56°C) while stirring often with a long wooden spoon to prevent burns. Remove from the heat and allow mixture to cool slightly to around 195°F (90.56° C). Pour the mixture into the deep side of the Wintering inner Cover. Pieces of pollen substitute patty (Ultra Bee Patties or Bee-Pro Patties) can be placed on the cover for added nutrition before pouring the sugar mixture. The candy hardens quickly so you will need to work fast. Before candy is totally set, remove jar and lid. Once candy is set, place candy side down on the hive for over-winter consumption. Moisture from the hive will soften the candy, making it easy for the bees to consume.
